Assignment 5

Evaluating Predictors

Recommended completion: Thursday, October 29, 2026, 11:59 p.m.
Hard deadline: Thursday, November 12, 2026, 11:59 p.m.
All dates and times are in **Mountain time**. Late submissions are not accepted.

Completion-based grading. A complete submission receives full assignment credit. The notebook's score out of 30 is diagnostic feedback to help you learn; you do not need to pass every test to receive completion credit. Missing submissions receive no credit.

1. Open the template and make your own copy

Open the Assignment 5 Colab notebook. A clean `ass5.ipynb` backup is also available on Canvas; use the Colab **Upload** tab to open that backup if needed.

Sign in with your University of Alberta Google account and select **File → Save a copy in Drive**. Work in your own copy so your changes are saved. **The notebook contains additional instructions, explanations, and requirements for each exercise. Read and follow those instructions throughout the notebook to complete the assignment.** This PDF explains how to start and submit.

2. Run setup and complete the exercises

Run the two setup cells at the top in order. They install the required packages and prepare the test cases; later cells generate the synthetic data. **You do not need to download or upload a separate dataset.** The setup needs an internet connection.

ONLY modify code between the following marker lines:

```
### YOUR CODE HERE ###
(replace placeholders here with your solution)
########################
```

Keep the marker lines intact. **Do not modify any provided supporting code outside these blocks:** function names and arguments, initialization, predictor and return code, imports, data loading, examples, plots, setup cells, test cases, or checker calls. Run the provided cells as written. After editing a solution, rerun its cell before checking it.

3. Check your solutions

Each question's quick check runs half its tests while you work: two each for Q1.1, Q1.2, and Q2.1, and three for Q3.1 (nine quick tests total). At the end, run `grader.check_all()` to run all 18 tests across the four questions, including the quick checks. Passing the quick checks alone does not mean all full checks will pass.

The final table shows your diagnostic score and question-level results. Expand a question's feedback to inspect failed tests. You can also run a single question's full checks with `grader.check("q2_1")`.

4. Submit your notebook on Canvas

1. Restart the Colab runtime and run all cells from the beginning. Review any execution errors and the final full-check feedback.
2. Save your notebook, then select **File → Download → Download .ipynb**.
3. Upload the downloaded `.ipynb` file to **Assignment 5 on Canvas** before the hard deadline. Confirm that Canvas shows your submission.

Submit the notebook file itself, rather than a Colab link, screenshot, or PDF. The instructor uses the same full set of test cases for diagnostic feedback; assignment credit follows the completion policy above.
